

JavaScript Variables

What is a **variable**?

A **variable** is a container
for different types of data.

(it's a good name because the data stored can change or vary)

variables pair:
a **storage location** with a **symbolic**
name

variables hold:
a **known** or **unknown**
quantity, information, or value

variables need:
a **clear**, **descriptive** name

(the separation of name and value allows them to be used independently)

variables are declared as:

```
var age = 20;
```

New!
ES6 variable
types

1 var name = 'Mark';

2

3 let name = 'Meredith';

4

5 const div = getElementById('message');

variable **actions** :
can be **accessed** at any time

variable **actions** :
can be **changed** at any time
(*except for* **const**)

What is **scope**?

Different types of **variables** have different **scope**

(where they can be accessed in the code)

a **local variable** :
declared **in a function** and can only
be called **within** that function

(it is invisible outside that function, think of it like a locker)

a **global variable** :
declared **outside a function** and can
only be accessed by **all** functions

```
1  var object = {  
2    name: 'Jaden Smith',  
3    age: 24  
4  };  
5  object.name = 'Will Smith';
```

If a variable is **declared in an object**,
it can be **accessed via the object**.

Let's look at an example

How do you **remove** a variable?
Mark it for **garbage collection!**

```
1 var penny = 1;  
2 penny = null;  
3 penny = undefined;
```

Variable **names**

When a **variable** is declared
memory is allocated to that variable

When naming a **variable** most languages are **case sensitive**:

Dog *will not reference* dog

(Be careful! 90% of code errors are caused by a spelling mistake)

NOVICE PROGRAMMER

EXPERIENCED PROGRAMMER

Many programmers use **conventions**
when writing code.

```
1 // This is an object because it starts with a capital letter
2 var Dog = {};
3
4 // This is a variable because it starts with a lower case
5 var dog = 'fido';
```

Sometimes you need to check a variable is **carrying** a certain value.

```
1  var a;  
2  console.log('The value of a is ' + a);  
3  // logs "The value of a is undefined"  
4  
5  console.log('The value of b is ' + b);  
6  // throws ReferenceError exception
```

Rules for naming variables

Do This	Not This
name should begin with letter , dollar sign , or underscore	Name cannot begin with a number
Name can contain letters , numbers , dollar sign , or underscore	Name cannot contain a dash or period
Make a name that describes the information contained , e.g. firstName	Do not use keywords , e.g. var , function , or anything else already used by JS
Use camel case for two words, e.g. firstName	Do not use spaces in names, e.g. first name

Practice Quiz!

```
1 var Enemy;
```

What would the above variable make you think it was? Why?

```
1 var speed = 10;
```

How would you mark the above variable called 'speed' for garbage collection?

```
1 var isSunUp = ??;
```

How would you write a boolean variable with a value?

```
1  for ( let i = 0; i < 5; i++;) {  
2    console.log(i);  
3  }
```

Now, what would the above output in the console?

```
1  for ( let i = 0; i < 5; i++) {  
2    console.log(i);  
3  }  
4  console.log(i);
```

What does line 4 log in the console? Why?
